Justice Lee Smalley Edmon, Chair
California Task Force on Access Through Innovation of Legal Services (ATILS)
State Bar of California
180 Howard Street
San Francisco, CA

Dear Justice Edmon and Task Force Members:

We write to express strong support for the recommendations put forward by the California task force on access through innovation in legal services. Before discussing the recommendations specifically, it is worth reviewing some background on our Center, and why we perceive an urgent need for reform.

**Background**

**Stanford CLP.** The Stanford Center on the Legal Profession is devoted to the study of precisely the kinds of questions that the task force has tackled: how should lawyers be regulated in order to preserve the profession’s core values while increasing access to justice.

One of us (Deborah Rhode) is the Director of the Center, has taught legal ethics at Stanford Law School for more than 30 years, was the founding president of the International Association of Legal Ethics, is the nation’s most frequently cited scholar on legal ethics, and has won multiple awards for her scholarship on regulation of the legal profession and access to justice. The other (Jason Solomon), the Executive Director of the Center, is a lawyer and educator who has written about the goals and practices of the civil justice system. Both of us share strong commitments to protecting lawyers’ independence of professional judgment. But there are other crucial values at stake, and the profession’s regulatory structure needs to reflect the public as well as the profession’s interest.

Rhode has written about the access to justice crisis for over three decades, and has long supported the bar’s conventional response: increased funding of civil legal aid, more pro bono efforts by private lawyers at firms and in-house, and related initiatives. But my research, and that of virtually every other respected scholar in the field, suggests that these efforts cannot move the needle on access to justice unless we also reform our regulation of the legal-services market in fundamental ways.

**Traditional Business Model is Obstacle to Access.** The principal obstacle to increasing access to legal assistance is the cost of the business model in which legal services have conventionally been available to ordinary individual consumers. That model relies largely on one-on-one lawyering, through traditional solo and small firm practices, generally billed on an hourly basis, supplemented by online assistance. The model forgoes the cost-reducing benefits of scale, branding, technology, and the ordinary efficiencies that would come from having lawyers specialize in legal functions, while others (software engineers, financial analysts, business managers, marketing experts, etc.) specialize in all the other functions. Why has the traditional model of legal service delivery not achieved greater efficiencies and lower costs?
The American approach to professional regulation is not the only answer, but it is clearly a major contributing factor. That approach is expressed primarily in the expansive rules on unauthorized practice of law and the restrictions on the corporate practice of law and fee sharing. Under that approach, all (paid) legal help must be provided by holders of an expensive graduate degree—the JD—who pass a state bar exam and hold a valid license from a state bar association. It must be provided by a law firm that is owned, managed and financed exclusively by lawyers. Lawyers who are employees of other entities can offer legal services only to their employer, not the public. Lawyers cannot enter profit- or revenue-sharing contracts with providers of complementary goods and services. These rules make the markets for legal services among the most, if not the most, intrusively regulated in the modern American economy. Even the practice of medicine is far more openly organized, particularly since the advent of health maintenance organizations.

The legal profession can be stronger—and consumers of legal services can be better served—if we make it easier for new business models to emerge other than the familiar “one to one” lawyer to client relationship through greater use of technology, and partnerships with and service from allied professionals.

The U.K. Example. The good news is that we have a very recent and familiar example to look to: England. Though there are important differences in the underlying regulatory scheme in England, the nation has a similar legal system and until quite recently (2007), had a similar system of self-regulation by lawyers that limited the kinds of business models that could provide legal services.

In recent years, England took steps much like those currently being recommended by the Task Force, including allowing new business models. It is still very early to assess England’s reforms, but independent evaluation suggests that “users of legal services are beginning to see benefits” such as improved access, choice and quality in the provision of legal services.¹ And there is “no evidence to suggest that these reforms have detrimentally affected, users of legal services.”²

An important aspect of England’s reforms is the establishment of an independent regulator to license entities and regulate them based on risk, which we urge the Task Force to consider seriously either at this stage, or in the implementation of Recommendation 2.1.³

Recent Legislative Changes. In amending the State Bar Act in 2017, the California legislature took two related and important steps: separating the state bar association from the regulator, and specifying that nearly half of the regulator’s Board be nonlawyers. These steps were designed to ensure that the regulator truly served the interests of the public, and not simply the profession, and the proposed ATILS reforms need to be evaluated with that important direction from the legislature in mind. As the U.S. Supreme Court recently explained, when the state delegates regulatory power to active market participants, as the California Supreme Court does, “ethical standards may blend with private anticompetitive motives in a way difficult for even market participants to discern.”⁴

In what may be a new era for antitrust enforcement of self-regulated professions, bar associations and state supreme courts must ensure that their regulation of lawyers is based on systematic attention to real,

not imagined, risks, and that those risks are appropriately balanced against the costs of regulations that raise costs, inhibit innovation, and fail adequately to protect consumers. It should not be at all surprising if the vast majority of comments submitted in response to these proposals are from lawyers expressing concern about possible changes. Their comments should certainly be taken seriously, but the ultimate decisions must be based on the benefits and risks to consumers.

The ATILS Recommendations

**Allied Legal Professionals.** California should move forward in developing a licensing system to allow qualified professionals who are not lawyers to offer personalized assistance on routine legal matters, as Recommendation 2.0 envisions. The licensing system could include consumer protections concerning qualifications, disclaimers, ethical standards, malpractice insurance, and discipline. Many administrative agencies already allow nonlawyers to appear, and no evidence suggests that their performance has been inadequate. The same is true in other nations that permit nonlawyers to provide legal advice and assist with routine documents. In one United Kingdom study, nonlawyers generally outperformed lawyers in terms of concrete results and client satisfaction. That and other research suggests that “it is specialization, not professional status, which appears to be the best predictor of quality.”5

The medical profession has managed to provide better service at lower cost by creating new, licensed professionals such as physician assistants and nurse practitioners. The legal profession can and should do the same. Note that this is not an open invitation to anyone to provide legal services. Providers would still need training and a license – it’s just a different kind of license than lawyers get -- and a regulator to help monitor quality.

In creating this new class of legal professional, California should be careful not to make the same mistake that Washington has made thus far with its limited license legal technicians. With the bar in Washington controlling the licensing process, the result has been excessively restrictive educational qualifications that work against creating an affordable alternative to attorneys.

You will no doubt hear from others who say: “Everyone deserves full representation from a real lawyer.” But we are long past that being a realistic possibility for individuals who are not wealthy and businesses who are not large. The question is: can we do more to foster a market environment that creates more options for individuals and small businesses between “nothing” and “wildly expensive”? We think we can and should.

**New business models.** Recommendations 1.1 and 3.1-3.3 would allow greater investment in legal service providers, as well as more possibilities for fee-sharing, and therefore make it easier for lawyers to partner with others with relevant expertise to build new business models to reach consumers. We support these recommendations as well.

There could be significant benefits from a greater infusion of capital into organizations that provide legal services. Traditionally, law firms have relied on the capital contributions of partners or outside borrowing to finance their work. But with law firm partners increasingly mobile, it becomes more difficult to rely on

capital contributions to invest in long-term needs. Moreover, excessive reliance on loans has been one of the precipitating causes of law firm dissolution.

Outside the legal sector, investment has helped companies expand access to financial services, medical care, and more. Often, this is through the use of technology, which is highly capital-intensive. To deliver affordable routine legal assistance, there is a particular need for outside investment to provide the necessary economies of scale.

There is no evidence of harm to consumers in other jurisdictions who have provided more flexibility in the kinds of structures and business models that can provide legal services. Lay investment in law firms is permitted in some form in Australia, England, Wales, Scotland, Germany, the Netherlands, New Zealand, and parts of Canada. The District of Columbia has permitted lay ownership interests for more than two decades, and the ABA’s Ethics 20/20 commission found no record of disciplinary concerns. Other jurisdictions have implemented safeguards such as subjecting alternative business structures to the same ethical rules as those governing legal professionals, as Australia and England have done. California could institute similar safeguards to mitigate any risk. In sum, there are many potential benefits and insufficient justification for denying the legal sector the benefit of the full range of investments used by other sectors in the economy.

Because the goal should be to unleash as much innovation as possible, while maintaining appropriate safeguards, we would support the broader Recommendation 3.2. These new business models may also benefit from pursuing Recommendation 3.4 to allow entities to market their services to consumers, many of whom may not even be aware that they have a problem with legal dimensions.

You will certainly hear from lawyers who worry that their existing business model would be under threat in re-regulated markets. That is a good indicator that you are on the right track. Though research indicates that there are plenty of untapped markets for legal service providers, it is in the public interest to have greater competition among different types of business models to provide higher quality service at lower cost.

Use of technology. We strongly support the recommendations designed to allow greater use of technology in the delivery of legal services. Technology is already benefitting people seeking legal help. Open Door Legal, an innovative legal aid organization in San Francisco, is using technology to help provide universal access to legal services to the Bayview neighborhood. A start-up called Upsolve uses technology to help people file for bankruptcy. And organizers and technologists in New York created an app called JustFix.nyc, which enables tenants to prepare legal documentation of substandard housing conditions – leading to much higher success rates in getting repairs than people without such support. With fewer restrictions on the use of technology, better calibrated to the actual risk of harm, legal service providers can use technology to provide even more and better support for consumers.

In thinking about how the use of technology can expand access to justice, it is important to understand how the mobile revolution has accelerated the use of technology across demographic groups, with 81% of all Americans now owning smartphones, including 71% of people making less than $30,000 a year, and 80% of African-Americans and Latinos. Low-income people use their smartphones for a variety of

tasks, with nearly 60% using their phone to look for jobs, for example. As a result, consumers have new and changing expectations about how they interact with all kinds of service providers, and user-friendly technology is a new norm.

A few years ago, a Stanford undergraduate invented an app called Do Not Pay that allows people to challenge traffic tickets without ever appearing in court. It has since expanded to enable people to sue in small claims court. No matter what happens with the regulation of legal services, these tools will inevitably grow. Better that they do so with involvement from lawyers and oversight by regulators.

To be sure, the regulator will have to develop a mechanism for assessing technology in order to minimize the risk of consumers receiving incorrect information. But in most cases, the possibility of harm will not be not enough to forgo the benefits, particularly when so many go without any legal assistance at all in important life situations such as eviction or child custody issues.

**Conclusion**

We cannot expect that these regulatory changes will lead to immediate or dramatic changes in access to legal services. It will take time for new market participants to enter and existing participants to evolve. But we can be confident that no meaningful progress is possible without such changes. The overwhelming balance of risks here is in going too slow, or changing too little. We urge you to move forward with strong versions of the ATILS recommendations.

Sincerely,

Deborah L. Rhode
